

Tools and Metrics for Comprehensive Impact

Research Excellence Framework (UK)

ResearchFish (UK)

ResearchFish is a tool used by many funding bodies in the UK as a way to track outputs and impacts of scientific work. ResearchFish is used almost universally by all public funding bodies in the UK. ResearchFish primarily a data collection tool into which [the scientific investigators enter data about their work and corresponding outputs](#) via a fine-grained question set. This information is fed back to the funding bodies. It is based on [early work within the RAND group led by Dr Steven Wooding](#).

In their [recent report \(mirror\)](#), the authors describe their definition of Impact as being the same as that of REF's.

They use the word output to describe both academic and wider (or [comprehensive](#)) impacts of research

Figure 1: Simplified view of outputs, outcomes and impact of research
